### Background

Serine/threonine kinase that phosphorylates preferentially the activated forms of a variety of Gprotein-coupled receptors(GPCRs). Such receptor phosphorylation initiates beta-arrestinmediated receptor desensitization, internalization, and signaling events leading to their downregulation. Phosphorylates a variety of GPCRs, including adrenergic receptors, muscarinic acetylcholine receptors(more specifically Gi-coupled M2/M4 subtypes), dopamine receptors and opioid receptors. In addition to GPCRs, also phosphorylates various substrates: Hsc70interacting protein/ST13, TP53/p53, HDAC5, and arrestin-1/ARRB1. Phosphorylation of ARRB1 by GRK5 inhibits G-protein independent MAPK1/MAPK3 signaling downstream of 5HT4-receptors. Phosphorylation of HDAC5, a repressor of myocyte enhancer factor 2(MEF2) leading to nuclear export of HDAC5 and allowing MEF2-mediated transcription. Phosphorylation of ST13 regulates internalization of the chemokine receptor. Phosphorylates rhodopsin(RHO)(in vitro) and a non G-protein-coupled receptor, LRP6 during Wnt signaling(in vitro).
