## Background

The nuclear pore complex is a massive structure that extends across the nuclear envelope, forming a gateway that regulates the flow of macromolecules between the nucleus and the cytoplasm. Nucleoporins are the main components of the nuclear pore complex in eukaryotic cells. The protein encoded by this gene is a member of the FG-repeat containing nucleoporins and is localized to the nuclear pore central plug. This protein associates with the importin alpha/beta complex which is involved in the import of proteins containing nuclear localization signals. Multiple transcript variants of this gene encode a single protein isoform.

## Immunogen information

Immunogen: nucleoporin 62 kDa
Synonyms: IBSN
Observed MW: $\quad 65 \mathrm{kDa}$
UniprotID : P37198

## Application

Reactivity: Human
