

(For Research Use Only. Not For Use In Diagnostic Procedures!)

## **FineTest**<sup>®</sup>

# KYN (Kynurenine) ELISA Kit

Catalogue No.: EU0188-CM Revision: V4.0 Size: 48T/96T

Please do not mix and use reagents from different kits or different batches. Otherwise, it might not work properly.

Please read the manual carefully before use. Feel free to contact us if you have any questions.

Email fine@fn-test.com

Website https://www.fn-test.com/

Please provide the batch number (see kit label) for more rapid response and services.

It's strongly recommended to use this kit within the expiry date printed on the kit label.

## **Product Features**

Application	For quantitative detection of KYN in Cell culture supernatant			
Reactivity	Universal Detection Method Competitive			
Range	46.875-3000pmol/ml Sensitivity 28.125pmol/ml			
Detection Duration	2 hours(excluding balancing and sample preparation)			
Samples needed for single well(Max)	Cell Culture Supernatant: 50ul, cell or tissue lysate: 50ul, Other liquid samples: 50ul			
Specificity	Specifically recognize KYN, no obvious cross reaction with other analogues			
Storage	2-8°C (for sealed box), please do not freeze! See kit label for expiry date			

## **Principle of the Assay**

This kit was based on Competitive-ELISA detection method. The microtiter plate provided in this kit has been pre-coated with KYN. During the reaction, KYN in the sample or standard competes with a fixed amount of KYN on the solid phase supporter for sites on the Biotinylated Detection Antibody specific to KYN. Excess conjugate and unbound sample or standard are washed from the plate, and HRP-Streptavidin (SABC) is added to each microplate well and incubated. Then TMB substrate solution is added to each well. The enzyme-substrate reaction is terminated by the addition of a acid solution and the color change is measured spectrophotometrically at a wavelength of 450nm. The concentration of KYN in the samples is then determined by comparing the OD of the samples to the standard curve. The concentration of the target substance was inversely proportional to the OD450 value.

#### **Kit Components and Storage**

The sealed kit can be stored at 2-8 °C. The storage condition for opened kit is specified in the table below:

No.	ltem	Size(48T)	Size(96T)	Storage Condition for Opened Kit
E001	ELISA Microplate(Dismountable)	8×6	8×12	Put the rest strips into a sealed foil bag with the desiccant. Stored for 1 month at 2-8°C; Stored for 6 month at - 20°C
E002	Lyophilized Standard	1vial	2vial	Put the lyophilized Standard and Biotin-labeled Antibody (lyophilized) into
E003	Biotin-labeled Antibody (Lyophilized)	1vial	1vial	a desiccant bag. Stored for 1 month at 2- 8°C; Stored for 6 month at -20°C
E034	HRP-Streptavidin Conjugate(SABC, 100X)	60ul	120ul	2-8°C (Avoid Direct Light)
E024	TMB Substrate	5ml	10ml	
E005	Purified water	200ul	200ul	
E039	Sample Dilution Buffer	10ml	20ml	
E040	Antibody Dilution Buffer	5ml	10ml	
E049	SABC Dilution Buffer	5ml	10ml	2-8°C
E026	Stop Solution	5ml	10ml	
E038	Wash Buffer(25X)	15ml	30ml	
E006	Plate Sealer	3 pieces	5 pieces	
E007	Product Description	1 сору	1 сору	

Note: The liquid reagent bottle contains slightly more reagent than indicated on the label. Please use pipette accurately measure and do proportional dilution.

#### **Required Instruments and Reagents**

- 1. Microplate reader (wavelength: 450nm)
- 2. 37°C incubator (CO<sub>2</sub> incubator for cell culture is not recommended.)
- 3. Automated plate washer or multi-channel pipette/5ml pipettor (for manual washing purpose)
- 4. Precision single (0.5-10μL, 5-50μL, 20-200μL, 200-1000μL) and multi-channel pipette with disposable tips(calibration is required before use.)
- 5. Sterile tubes and Eppendorf tubes with disposable tips
- 6. Absorbent paper and loading slot
- 7. Deionized or distilled water

## Sample Collection and Storage

The following sample processing steps are concise operations. For detailed sample preparation guideline, please refer to the Quick Mark or the link (https://www.fn-test.com/content/uploads/2022/06/ELISA-Sample-Preparation-Protocol-2022.6.6.pdf).

#### 1. Cell Culture Supernatant

Collect the supernatant: Centrifuge at 2500 rpm at  $2-8^{\circ}$ C for 5 minutes, then collect clarified cell culture supernatant to detect immediately. Or you can aliquot the supernatant and store it at -80°C for future's assay.

#### 2. Other Biological Sample

Centrifuge samples for 15 minutes at  $1000 \times g$  at  $2-8^{\circ}C$ . Collect the supernatant to detect immediately. Or you can aliquot the supernatant and store it at  $-80^{\circ}C$  for future's assay.

#### **Notes for Samples**

1. The best sample storage condition: less than 5 days at  $2-8^{\circ}$ C; within 6 months at  $-20^{\circ}$ C; within 2 years at  $-80^{\circ}$ C. Stored in liquid nitrogen for a longer storage. When melting frozen samples, rapid water bath at  $15-25^{\circ}$ C

can decrease the effect of ice crystal ( $0^{\circ}$ C) on the sample. After melting, centrifuge to remove the precipitate, and then mix well.

2. The detection range of this kit is not equivalent to the concentration of analyze in the sample. For analyses with higher or lower concentration, please properly dilute or concentrate the sample.

3. Pretest is recommended for special samples without reference data to validate the validity.

## **Precautions for Kits**

1. When using different Elisa kits, labeling is required to avoid mixed components and failed assay.

2. After opening the kit, please refer to the table of storage condition for coated plate and standards (Dampness may decrease the activity.). If any component is missing or damaged during the assay or storage, please contact us for ordering a new one to replace.(e.g. E002 lyophilized standard)

3. Sterile and disposable tips are required during the assay. After use, the reagents bottle cap has to be tightened to avoid the microbial contamination and evaporation.

4. While manual washing, please keep tips or pipettors for adding wash buffer away from the well. Insufficient washing or contamination easily causes false positive and high background.

5. During the assay, prepare required reagents for next step in advance. After washing, add the reagent into the well in time to avoid dryness. Otherwise, dry plate will result in the failed assay.

6. Before confirmation, reagents from other batches or sources should not be used in this kit.

7. Don't reuse tips and tubes to avoid cross contamination.

8. After loading, seal the plate to avoid the evaporation of the sample during incubation. Complete the incubation process at recommended temperature.

9. Please wear the lab coat, mask and gloves to protect yourself during the assay. Especially, for the detection of blood or other body fluid samples, please follow regulations on safety protection of biological laboratory.

#### **Recommended Sample Dilution Ratio**

Please refer to the universal dilution ratio below. (The ratio is suitable for single-well assay. For duplicate assay, please follow the calculation: volume of sample and diluent x number of duplicate well)

For 2 fold dilution (1/2): One step dilution. Add 60µL sample into 60µL sample diluent and mix gently.

For 5 fold dilution (1/5): One step dilution. Add 24µL sample into 96µL sample diluent and mix gently.

For 10 fold dilution (1/10): One step dilution. Add 12µL sample into 108µL sample diluent and mix gently.

For 20 fold dilution (1/20): One step dilution. Add 6µL sample into 114µL sample diluent and mix gently.

For 50 fold dilution (1/50): One step dilution. Add  $3\mu$ L sample and  $47\mu$ L normal saline (0.9% NaCl) into 100  $\mu$ L sample diluent and mix gently.

For 100 fold dilution (1/100): One step dilution. Add  $3\mu$ L sample and  $177\mu$ L normal saline into  $120\mu$ L sample diluent and mix gently.

For 1000 fold dilution (1/1000): Two step dilution. Create a 50-fold dilution first (normal saline is used throughout the dilution). Then, create a 20-fold dilution and mix gently.

For 10000 fold dilution (1/10000): Two step dilution. Create a 100-fold dilution first (normal saline is used throughout the dilution). Then, create the same dilution again and mix gently.

For 100000 fold dilution (1/100000): Three step dilution. Create a 50-fold dilution and 20-fold dilution respectively (normal saline is used in the first two steps.) Finally, create a 100-fold dilution and mix gently.

Notes: The volume in each dilution is not less than 3µL. Dilution factor should be within 100 fold. Mixing during dilution is required to avoid foaming.

#### **Reagent Preparation and Storage**

Take the Elisa kit from the fridge around 20 minutes earlier and equilibrate to room temperature( $18-25^{\circ}C$ ). For repeated assays, please just take the strips and standards required for the current assay, store the rest materials according to the relevant condition.

## 1. Wash Buffer

Dilute 30ml (15ml for 48T) concentrated wash buffer to 750ml (375ml for 48T) wash buffer with deionized or distilled water and mix well. (The recommended resistivity of ultrapure water is  $18M\Omega$ .) Alternatively, take appropriate amount of concentrated wash buffer according to the assay requirement, then create a 25-fold dilution and mix well. Store the rest solution at 2-8°C.

Crystals formed in the concentrated wash buffer can be heated by water bath at 40  $^{\circ}$ C till complete dissolution. (Heating temperature should be below 50  $^{\circ}$ C.) Mix well for the next step. It's better to use up the prepared wash buffer in one day. Store the rest buffer at 2-8  $^{\circ}$ C within 48h.

## 2. Standards

2.1. Centrifuge standards tube for 1min at 10000xg. Label it as Zero tube.

2.2. Add 1ml sample dilution buffer into the standard tube. Tighten the tube cap and Let it stand for 2min at room temperature. Invert the tube several times to mix gently. (Or you can mix it using a low speed vortex mixer for 3-5 seconds.)

2.3. Centrifuge the tubes for 1min at 1000xg, making the liquid towards the bottom of tube and removing possible bubbles.

2.4. Standard dilution: Label 7 EP tubes with 1/2, 1/4, 1/8, 1/16, 1/32, 1/64 and blank respectively. Add 0.3ml of the sample dilution buffer into each tube. Add 0.3ml solution from zero tube into 1/2 tube and mix them thoroughly. Transfer 0.3ml from 1/2 tube into 1/4 tube and mix them thoroughly. Transfer 0.3ml from 1/4 tube into 1/8 tube and mix them thoroughly, so on till 1/64 tube. Now blank tube only contain 0.3ml sample dilution buffer. The standard concentration from zero tube to blank tube is 3000pmol/ml, 1500pmol/ml, 375pmol/ml, 187.5pmol/ml, 93.75pmol/ml, 46.875pmol/ml, 0pmol/ml.

Prepare standard solutions

Notes: Store the zero tube with dissolved standards at  $2-8^{\circ}$ C and use it within 12h. Other diluted working solutions containing standards should be used in 2h.

## 3. Preparation of Biotin-labeled Antibody Working Solution

The working solution should be prepared within 30min before the assay and can't be stored for a long time.

3.1. **Dissolve**: Centrifuge for 1min at 2000xg and bring down the concentrated biotin-labeled antibody to the bottom of tube. Add 70ul purified water into tube and mix them thoroughly, after the biotin-labeled antibody is dissolved, please store it at 2-8°C.

3.2. Calculate required total volume of the working solution: 50ul/well x quantity of wells. (It's better to prepare additional 100ul-200ul.)

3.3. Dilute the biotinylated detection antibody with antibody dilution buffer at 1/100 and mix them thoroughly. (e.g. Add 10ul concentrated biotin-labeled antibody into 990ul antibody dilution buffer.)

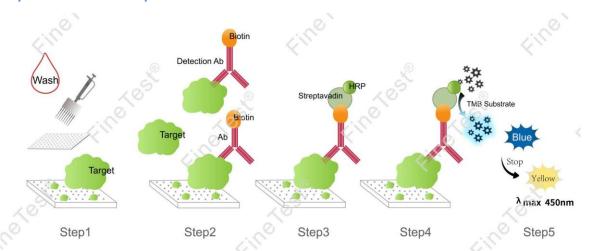

## 4. Preparation of HRP-Streptavidin Conjugate (SABC) Working Solution

The working solution should be prepared within 30min before the assay and can't be stored for a long time.

4.1. Calculate required total volume of the working solution: 100ul/well x quantity of wells. (It's better to prepare additional 100ul-200ul.)

4.2. Centrifuge for 1min at 1000xg in low speed and bring down the concentrated SABC to the bottom of tube.

4.3. Dilute the concentrated SABC with SABC dilution buffer at 1/100 and mix them thoroughly. (e.g. Add 10ul concentrated SABC into 990ul SABC dilution buffer.)

#### **Assay Procedure Summary**

Step1: Wash plate 2 times before adding Standard, Sample and Control (blank) wells!

**Step2:** Add 50ul Standard or Sample into each well. Immediately add 50ul Biotin-labeled Antibody into each well, gently tap the plate for 1min to ensure thorough mixing then static incubate for 45 minutes at 37°C.

Washing: Wash the plate three times and immerse for 1min each time.

**Step 3:** Add 100ul SABC working solution into each well, seal the plate and static incubate for 30 minutes at 37°C.

Washing: Wash the plate five times and immerse for 1min each time.

**Step 4:** Add 90ul TMB substrate solution, seal the plate and static incubate for 10-20 minutes at 37°C. (Accurate TMB visualization control is required.)

**Step 5:** Add 50ul stop solution. Read at 450nm immediately and calculate.

#### **Detailed Assay Procedure**

When diluting samples and reagents, they must be mixed completely. It's recommended to plot a standard curve for each test.

1. Set standard, pilot samples, control (blank) wells on the pre-coated plate respectively, and then, records their positions. It's recommended to measure each standard and sample in duplicate to decrease experimental errors. Wash plate 2 times before adding standard, sample and control (blank) wells!

2. Standards and samples loading: Aliquot 50ul of zero tube, 1<sup>st</sup> tube, 2<sup>nd</sup> tube, 3<sup>rd</sup> tube, 4<sup>th</sup> tube into each standard well. Also add 50ul sample dilution buffer into the control (blank) well. Then, add 50ul pilot samples into each sample well. Immediately add 50ul Biotin-labeled Antibody Working Solution into each well, gently tap the plate for 1min to ensure thorough mixing then static incubate for 45 minutes at 37°C. (Please keep tips or pipettors for adding Biotin-labeled Antibody away from the liquid level.)

3. Wash three times: Remove the cover, then absorb the liquid in the plate or tap the plate on a clean absorbent paper two or three times. Add 350ul wash buffer into each well and immerse for 1min. Discard the liquid in the well and tap on the absorbent paper again. Repeat the washing step three times.

4. HRP-Streptavidin Conjugate (SABC): Add 100ul SABC working solution into each well. Seal the plate and static incubate for 30 minutes at 37°C. (Put the whole bottle of TMB into the 37°C incubator to equilibrate)

5. Wash five times: Remove the cover, and then wash the plate with wash buffer five times. Read washing method in step 3.

6. TMB Substrate: Add 90ul TMB Substrate into each well, seal the plate and static incubate at 37°C in dark within 10-20 minutes. Run the microplate reader and preheat for 15min.

(Notes: Please do not use the reagent reservoirs used by HRP couplings. The reaction time can be shortened or extended according to the actual color change, but not more than 30 minutes. You can terminate the reaction when apparent gradient appeared in standard wells. Weaker or stronger color intensity is unacceptable. Please refer to TMB color rendering control in page 2 or QR code for detail.)

7. Stop: Keep the liquid in the well after staining. Add 50ul stop solution into each well. The color will turn yellow immediately. The order for adding stop solution and TMB substrate solution is the same.

8. OD Measurement: Read the O.D. absorbance at 450nm in a microplate reader immediately. (If your microplate reader has a choice of correction wavelength, set it to 570nm or 630nm. Correct the read value to the OD450 value minus the OD570 or OD630 value. In this way, the OD value of non-chromogenic substances can be corrected and removed, thus obtaining more accurate results. If the microplate reader does not have a 570nm or 630nm wavelength, the original OD450 value can be used.)

## **Calculation of Results**

## (<u>Operate Video</u>: https://www.fn-test.com/videos/elisa-sample-concentration-calculation/)

1. Calculate the mean OD450 value (using the original OD450 value or the corrected OD450 value) of the duplicate readings for each standard, control, and sample.

2. Create a four parameter logistic curve by plotting the mean absorbance for each standard on the y-axis against the concentration on the x-axis. Alternatively, you can use the curve fitting software offered by the microplate reader (e.g. Thermo Skanlt RE software, <u>Curve Expert 1.3 or 1.4</u> available in FineTest website).

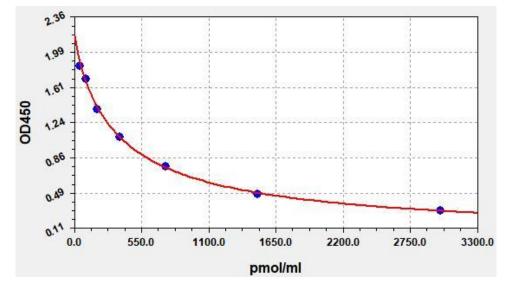

3. Calculate the sample concentration by substituting OD450 value into the standard curve. Diluted samples should be multiplied by the relevant dilution ratio.

## Typical Data & Standard Curve

The following assay data are provided for reference, since experimental environment and operation are different. The establishment of standard curve depends on your own assay.

STD.(pmol/ml)	OD-1	OD-2	Average
0	2.131	2.24	2.175
46.875	1.8	1.892	1.837
93.75	1.667	1.752	1.701
187.5	1.355	1.424	1.382
375	1.059	1.113	1.08
750	0.754	0.793	0.77
1500	0.464	0.488	0.473
3000	0.292	0.307	0.298

## Precision

Intra-assay Precision: samples with low, medium and high concentration are tested 20 times on same plate.

Inter-assay Precision: samples with low, medium and high concentration are tested 20 times on three different plates.

ltem	Intra-assay Precision		Item Intra-assay Precision		Int	er-assay Precis	ion
Sample	1	2	3	1	2	3	
n	20	20	20	20	20	20	
Mean (pmol/ml)	92.45	380.7	1494	93.19	371.8	1516	
Standard deviation	4.67	20.18	79.93	4.9	19.63	80.04	
CV(%)	5.05	5.3	5.35	5.26	5.28	5.28	

#### Recovery

Add a certain amount of KYN into the sample. Calculate the recovery by comparing the measured value with the expected amount of KYN in the sample.

Matrix	Recovery Range (%)	Average (%)
Cell culture supernatant (n=5)	95-103	100

## Linearity

Dilute the sample with a certain amount of KYN at 1:2, 1:4 and 1:8 to get the recovery range.

Matrix	1:2	1:4	1:8
Cell culture supernatant (n=5)	89-100%	87-100%	83-97%

#### **Stability**

Perform the stability test for the sealed kit at 37°C and 2-8°C and get relevant data.

Elisa kit(n=5)	37°C for 1 month	2-8°C for 6 months
Average (%)	80	95-100

## **ELISA Troubleshooting**

If the ELISA result is unsatisfied, please take a screenshot for the staining result and store the OD data. Keep used strips as well the rest reagents. Contact us to solve your problem with the kit's catalogue number and batch number. You can also refer to the following table to check the reason.

Standard curve without signalIncorrect order for adding reagentsConfirm the required reagent added in each step. Mix all reagents completely.     Inconsistent pipetting   Use calibrated pipette and correct pipetting method.     Standard curve with low signal   Standards are improperly reconstituted.		Unclean plate	
Each well is washed unevenly.   Check whether the tube of the washer is smooth.     Reagents are not completely mixed.   Mix all reagents completely.     Inconsistent pipetting   Use calibrated pipette and correct pipetting method.     Standard curve with low signal   Standards are improperly reconstituted.	High CV%	Foam is found in the well.	
Inconsistent pipetting   Use calibrated pipette and correct pipetting method.     Standard curve with low signal   Standards are improperly reconstituted.   Before opening, shortly centrifuge the lyophilized standard tube till complete dissolution.	0	Each well is washed unevenly.	
Inconsistent pipetting   method.     Standard curve with low signal   Standards are improperly reconstituted.   Before opening, shortly centrifuge the lyophilized standard tube till complete dissolution.		Reagents are not completely mixed.	Mix all reagents completely.
Standards are improperly Iyophilized standard tube till complete   Standard curve reconstituted.   with low signal Ito a local data data data		Inconsistent pipetting	
			lyophilized standard tube till complete
i onow suggested storage conditions for		Standards have been degraded.	Follow suggested storage conditions for

		standards.
	When pipetting, the required volume is incorrect or inaccurate.	Use calibrated pipette and correct pipetting method.
	Expired kit	Don't use expired products.
	Improper storage	Follow suggested storage conditions for all components.
	The well is over dried.	The assay and sample loading process can't be terminated. Especially after washing the plate, add reagents immediately. Seal the plate during incubation.
	Slow colorimetric reaction	Before use, equilibrate the whole bottle of TMB substrate for 30min at 37°C. Extend the incubation time.
	The wavelength of the microplate reader is incorrect.	Check the wavelength and read the OD450 value again.
	The well is washed excessively.	Follow suggested washing times in this manual.
	Insufficient washing	Follow suggested washing times in this manual.
	Wash buffer is contaminated.	Use the prepared wash buffer immediately. During manual washing, add wash buffer without touching the well.
High Background	Too many detection reagents or higher concentration.	Use calibrated pipette and correct pipetting method.
	Reading of assay result is not in time.	Read the assay result immediately after adding the stop solution.
	TMB substrate is incubated in strong light.	During colorimetry, incubate in the dark.

#### Declaration

1. Limited to current conditions and scientific techniques, all raw materials are not completely identified and analyzed. This product may have a technology-related quality risk.

2. During the Elisa kit development, some endogenous interferons(not all) in the biological sample have been removed or decreased.

3. The final assay result is related to the validity of reagents, experimental operation and environment. FineTest is only responsible for this kit, excluding sample consumption during using this kit. Before use, please consider and prepare enough samples required by the assay.

4. To get a satisfied assay result, please use all reagents offered by this kit. Don't use any product from other vendors. Strictly follow instructions of this manual.

5. During assay procedure, incorrect reagents preparation and parameter setting of the microplate reader may result in the abnormal result. Before assay, please read this manual carefully and adjust instruments.

6. Even if the assay is performed by the same person, results in two independent assays may be different. Thus, each step in the assay should be controlled to ensure the reproducibility.

7. Before delivery, this kit is subject to the strict QC. Influenced by transportation conditions and experimental devices, the assay result got by the customer may be different from original data. Inter-assay CV between different batches may be caused by reasons before.

8. This kit is not compared to similar kits from other vendors or methods for testing the same detection target. Thus, assay results may be inconsistent.

9. This kit allows for research use only. For IVD or other purposes, FineTest is not responsible for relevant consequences and doesn't bear any legal liability.
